**UA-11**

**Tank Level Sensor**

**Non-contact Liquid Level Detection**

UA-11 detects the inner liquid level from outside the tank, keeping the contents intact. Useful for tank storing corrosive liquids or tanks storing pure liquids in the food, medical, and pharmaceutical industries where hygiene is important.

**Easy Installation on Tank Wall**

No opening is required in the wall to install UA-11. It is mountable by a metal belt fastened around the tank or by a bracket welded on the tank.

**Easy Internal Cleaning of Tank**

There is no need to remove UA-11 for washing the inside of the tank because of its outside placement.

**No Controller Required**

As the amplifier is built-in, no additional controller is needed. Further, the 5m long attached cable can be extended up to 100m overall.

**Two Bright Indicators Incorporated**

It incorporates a red operation indicator and a green stability indicator to reveal the operating conditions at a glance.

**Sound Emission Lock**

This function is useful for a sensor operation check or a mutual interference prevention check by stopping the ultrasonic emission.

---

**CE Marked**

Conforming to EMC Directive

**I/O CIRCUIT AND WIRING DIAGRAMS**

I/O circuit diagram

Wiring diagram

Symbols ... D: Reverse supply polarity protection diode
Dz: Reverse current protection diode
Zv, Zoz: Surge absorption zener diode
Tr, Tr: NPN output transistor
C: Capacitor

Notes: 1) Connection to 0V stops ultrasonic emission.
2) If the external synchronization input is connected through a non-voltage contact, confirm the response time before use.
PRECAUTIONS FOR PROPER USE

This product is not a safety sensor. Its use is not intended or designed to protect life and prevent body injury or property damage from dangerous parts of machinery. It is a normal liquid detection sensor.

Mounting

1. Align the upper part of the sensor-side mounting bracket (MS-UA11-2) with the position on the tank diameter scale, on the sensor main body, which corresponds to the used tank diameter, and fix with M4 (length 6mm) set screws at three points. The tightening torque should be 0.58N•m or less.

2. Fix the optional tank-side mounting bracket MS-UA11-1 on the tank by belt mounting or weld mounting as follows.

Belt mounting

(1) Prepare two belts of different lengths by cutting UA-B with nippers. One should be over 500mm long. The second belt should be approximately the tank circumference minus 200mm. Round the cut ends of the belts to avoid any injury.

(2) Insert one end of the 500mm belt through the trapping slot on one side of MS-UA11-1 and fold it back inside 100mm or more. Insert the other end through the slit on the UA-BK1 buckle and fold it back inside 100mm or more. The distance between MS-UA11-1 and UA-BK1 should be 300mm or more.

(3) Insert one end of the other belt through the trapping slot on the other side of MS-UA11-1 and fold it back inside 100mm or more.

(4) Route it around the tank and insert its other end through the UA-BK1 buckle over the first belt as shown. Pull it tight and engage it on the hook of the buckle.

(5) Tighten the belts by screwing at the buckle with a ‘minus’ screwdriver. The tightening torque should be 0.74N•m approx. Take care not to deform the tank by tightening.

Notes: 1) Use two or more UA-BK1 buckles around a large tank, 2m or more in diameter.
2) The belts (UA-B) should be fastened so as to be parallel to a horizontal section of the tank. If not, as the belt becomes loose, the detectability will deteriorate.
3) Do not mount with a belt on a cubic tank. In this case mount by welding.

Weld mounting

(1) Weld MS-UA11-1 on the tank wall at the four corners.

Note: If the tightening is insufficient, unbalanced or incorrect, it weakens the pressure of the sensing face against the tank wall, generating a tilt. Uneven surface contact will lead to incorrect sensor operation.

Material: Stainless steel (SUS304)

Sensor-side mounting bracket (MS-UA11-2)

Sensor-side mounting bracket (MS-UA11-2)

Note: Welding may yield a gap between the tank-side mounting bracket (MS-UA11-1) and the tank’s outer wall. In this case, since the tank diameter scale cannot be used as it is, when the sensor is fixed on the sensor-side mounting bracket (MS-UA11-2), set the sensor at a position which is shifted, with respect to the position indicated by the tank diameter scale, towards the cable side by an amount equal to the gap. The following procedure may also be used to set the sensor.

(3) The sensor is pressed tightly against the tank’s outer wall.
(4) Under the condition of (3), fix the sensor and the sensor-side mounting bracket (MS-UA11-2) with M4 (length 6mm) set screws at such a position that there is a gap of 5mm approx. between the tank-side mounting bracket (MS-UA11-1) and the sensor-side mounting bracket (MS-UA11-2).

(5) Fix MS-UA11-2 holding the sensor to MS-UA11-1 with two M5 (length 15mm) hexagon-socket-head bolts. Each bolt must be fitted with a spring and a plain washer. Tighten the bolts alternately so that the sensing face contacts the tank surface evenly and the sensor is perpendicular to the wall surface. The tightening torque should be 2.94N•m or less.

Do not deform the tank by tightening.

PRECAUTIONS FOR PROPER USE

Caution on mounting

- Always handle the edges of the belts (UA-B) carefully to avoid any injury.
- In case the paste enters your eye, wash your eyes thoroughly with water and consult an eye doctor immediately.
- If the paste sticks to your skin, wash it off thoroughly with water.
- Make sure to test for compatibility with your tank before actual use.

UA-11 cannot be used with the following tank constructions.
- A multi-layered tank, such as, a tank having a thermal insulating jacket for cooling or heat-retaining
- A cone-shaped tank
- A tank with a pipe, a fin, an agitator, or a shaker inside, which obstructs the sound propagation
- A tank having a resin lining
- A tank storing liquid that is highly viscous, or includes grains, bubbles, or layers of different ingredients
- Keep air out of the contact section between the sensing face and the tank wall.
- Remove paint, rust, moisture, dirt, and dust off the mounting surface of the tank with sand paper or a cloth dampened with ethyl alcohol before mounting the sensor.
- At the time of shifting the sensor position, remove the sensor from the tank, completely wipe the paste off the sensor head, and apply fresh paste.
- Do not keep the paste in places exposed to direct sunlight or having high humidity.
- The scale on the sensor body is calibrated only for a cylindrical tank when using MS-UA11-1 and MS-UA11-2.
- Waves on the liquid surface may cause the output and the operation indicator to flicker. This does not indicate any abnormality.
- A flow in the liquid may affect the detectability.
- If the paste flows out from the contact section between the sensing face and the tank wall, the detectability may deteriorate. Keep the contact section away from chemical agents, or heavy splashes of water.
- If the tank wall is much thicker than the specified range or the sensitivity is too high for the tank size, the derivative sound returned around the tank wall may cause the sensor to generate an output with no liquid. In this case, reduce the sensitivity, and check that the output is ON when the liquid level is higher than the sensing point, and OFF when the level is lower than it, up to the empty state.
- Make sure to test for compatibility with your tank before actual use.

Sensitivity adjustment

<Adjusting Procedure>

1. Set the primary sensitivity switch for your tank using the following table as a reference.

<table>
<thead>
<tr>
<th>Step</th>
<th>Operation</th>
<th>Sensitivity switch/adjuster</th>
</tr>
</thead>
<tbody>
<tr>
<td>①</td>
<td>A 1,000 to 3,000</td>
<td>Primary sensitivity switch</td>
</tr>
<tr>
<td>②</td>
<td>Fill the tank until the level is higher than the sensor mounting position. Turn the adjuster gradually clockwise up to the point A, where both the operation indicator and the stability indicator light up. If the indicators do not light up, even if the adjuster is turned fully clockwise, shift the primary sensitivity switch up one position on the scale and perform steps ② and ① again.</td>
<td></td>
</tr>
<tr>
<td>③</td>
<td>Drain the contents from the tank until the level is lower than the sensor mounting position. Turn the adjuster clockwise until the operation indicator lights off and the stability indicator lights up. Turn the adjuster clockwise to the point B.</td>
<td></td>
</tr>
<tr>
<td>④</td>
<td>Set the adjuster at the center between the points A and B, which is the optimum sensitivity position.</td>
<td></td>
</tr>
<tr>

</tbody>
</table>

Enclosure earthing

- UA-11 utilizes capacitor earthing to improve noise characteristics.

Do not use any auto-transformer (single winding transformer) to supply power.
PRECAUTIONS FOR PROPER USE

Sound emission lock function
• The emission of sound is suspended when the sound emission lock input is connected to 0V. This can be used to check the sensor operation while the level is higher than the sensor mounting position, and to check interference prevention.

Interference prevention function
• If two or more sensors are adjacently mounted on a tank, mutual interference may occur. Interference can be prevented using the interference prevention function by the input of external synchronization signals so that each sensor operates as per the synchronization signal timing.

Wiring
• Make sure to carry out the wiring in the power supply off condition.
• Verify that the supply voltage variation is within the rating.
• If power is supplied from a commercial switching regulator, ensure that the frame ground (F.G.) terminal of the power supply is connected to an actual ground.
• In case noise generating equipment (switching regulator, inverter motor, etc.) is used in the vicinity of this product, connect the frame ground (F.G.) terminal of the equipment to an actual ground.
• Make sure to connect the metal tank on which UA-11 is mounted to the frame ground (F.G.) terminal.
• Do not run the wires together with high-voltage lines or power lines or put them in the same raceway. This can cause malfunction due to induction.

Others
• Do not use during the initial transient time (50ms) after the power supply is switched on.
